Cloud Computing, Voice over IP (VoIP), SaaS, and a host of other emerging technologies are fundamentally changing the way business is done. As this shift occurs, the tools for business are becoming more and more network dependent. At the same time, concerns about using the Public Internet for these applications are growing.

EarthLink Business's AX is the vision for delivering the benefits of cloud-based technologies with the stability and security of a secure, customer-owned network. And, with the Class-of-Service (CoS) option, customers can prioritize their most important applications across the network.

AX PARTNERS

Customers can choose from a growing list of application providers. AX partners currently include leading Voice over IP (VoIP) providers and Credit Card payment processors. AX participants have been fully vetted and their services have been tested and approved to be interoperable with EarthLink Business's MPLS service.

ABOUT EARTHLINK BUSINESS

EarthLink Business builds and manages secure MPLS networks with service level agreements managed over its award-winning portal and operates one of the largest private backbone networks in the United States providing network connections to over 40,000 business locations. Unlike other carriers, EarthLink Business customers can choose a blend of available access technologies – from business-class DSL and T1 lines to fiber-optic and Ethernet connections – for building secure MPLS networks. As a result, businesses can mix access technologies based on the specific needs at each location without compromising key MPLS benefits in order to reduce network costs.
